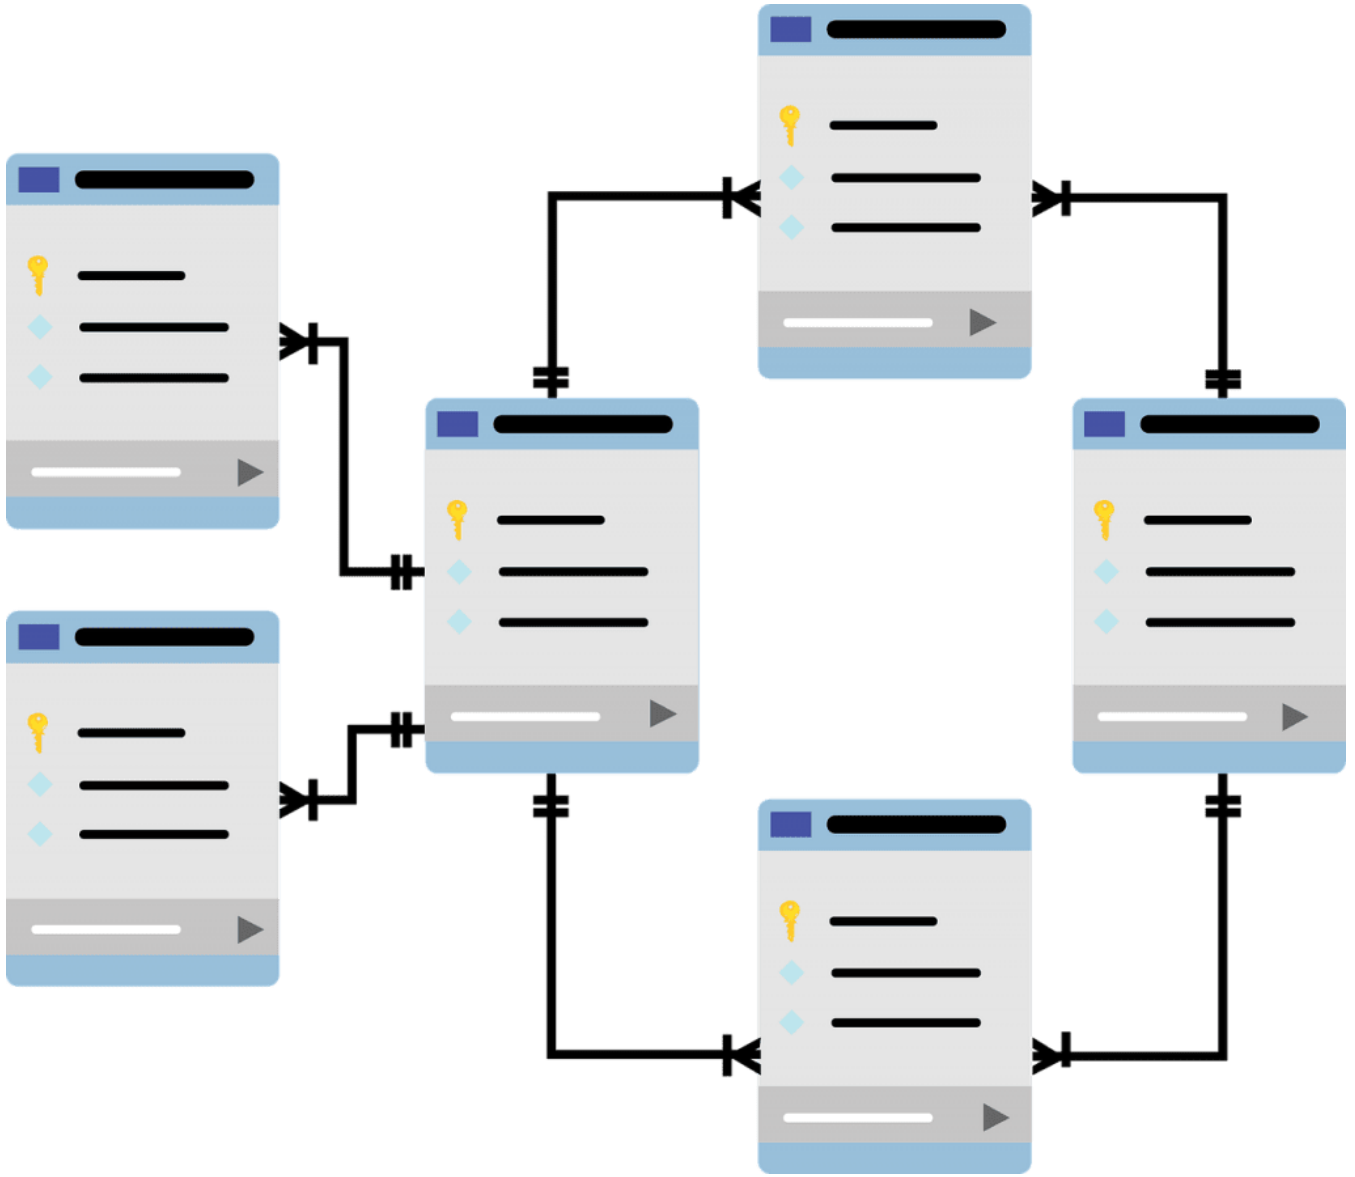
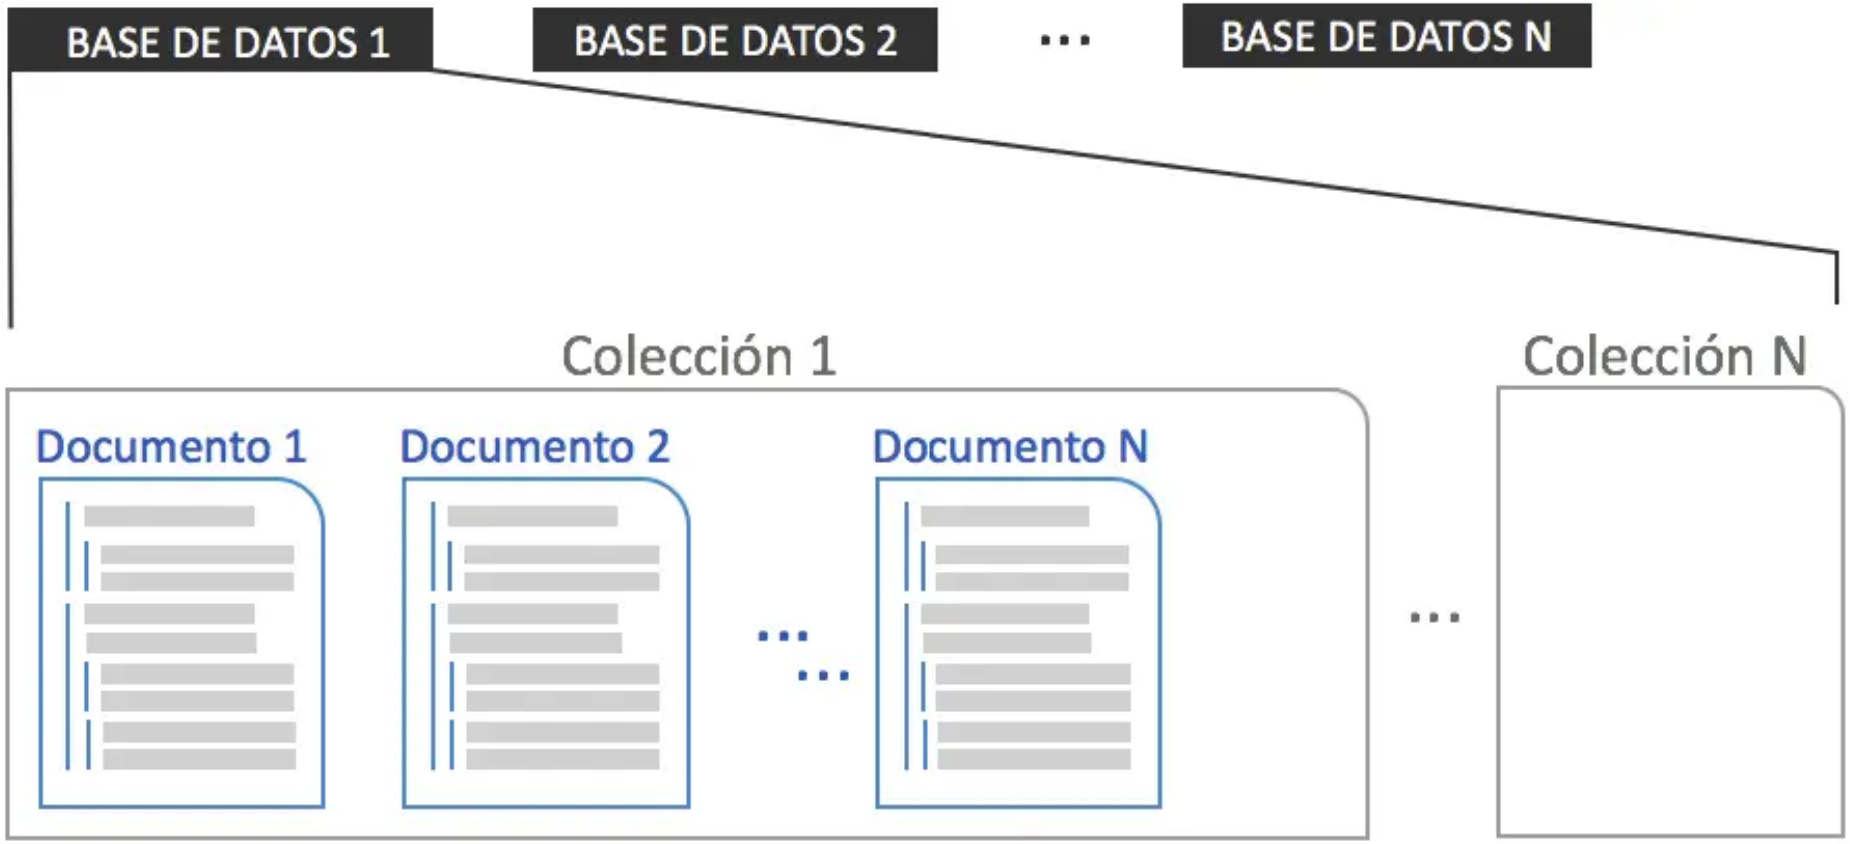
MODELO RELACIONAL

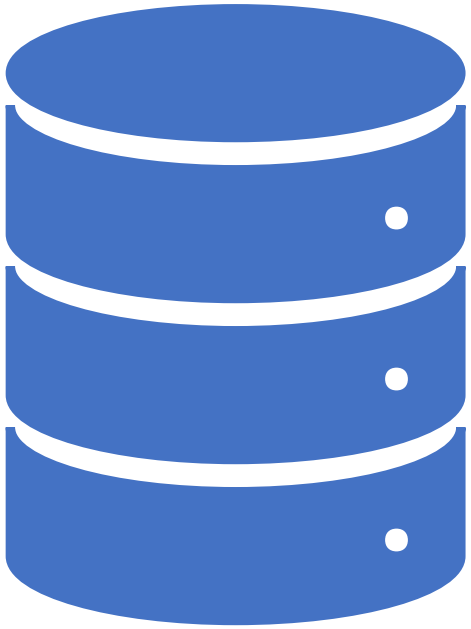


Microsoft Learn

MOTORES NOSQL

BASE DE DATOS DOCUMENTAL





MONGODB

- El gestor de base de datos MongoDB se lo puede asociar a un conjunto de gestores de bases de datos que no tienen como lenguaje principal el SQL para su manipulación.
- Los gestores de bases de datos NoSQL no requieren estructuras fijas como tablas, normalmente no soportan operaciones join y presentan como gran ventaja que pueden escalar en forma sencilla.

CARACTERÍSTICAS MONGODB

- Indexación
- Replicación
- Balanceo de carga
- Almacenamiento de archivos
- Agregación

JSON

```
{
  codigo: 1,
  nombre: 'El aleph',
  autor: 'Borges',
  editoriales: ['Planeta','Siglo XXI']
}
```

Create Read Update Delete

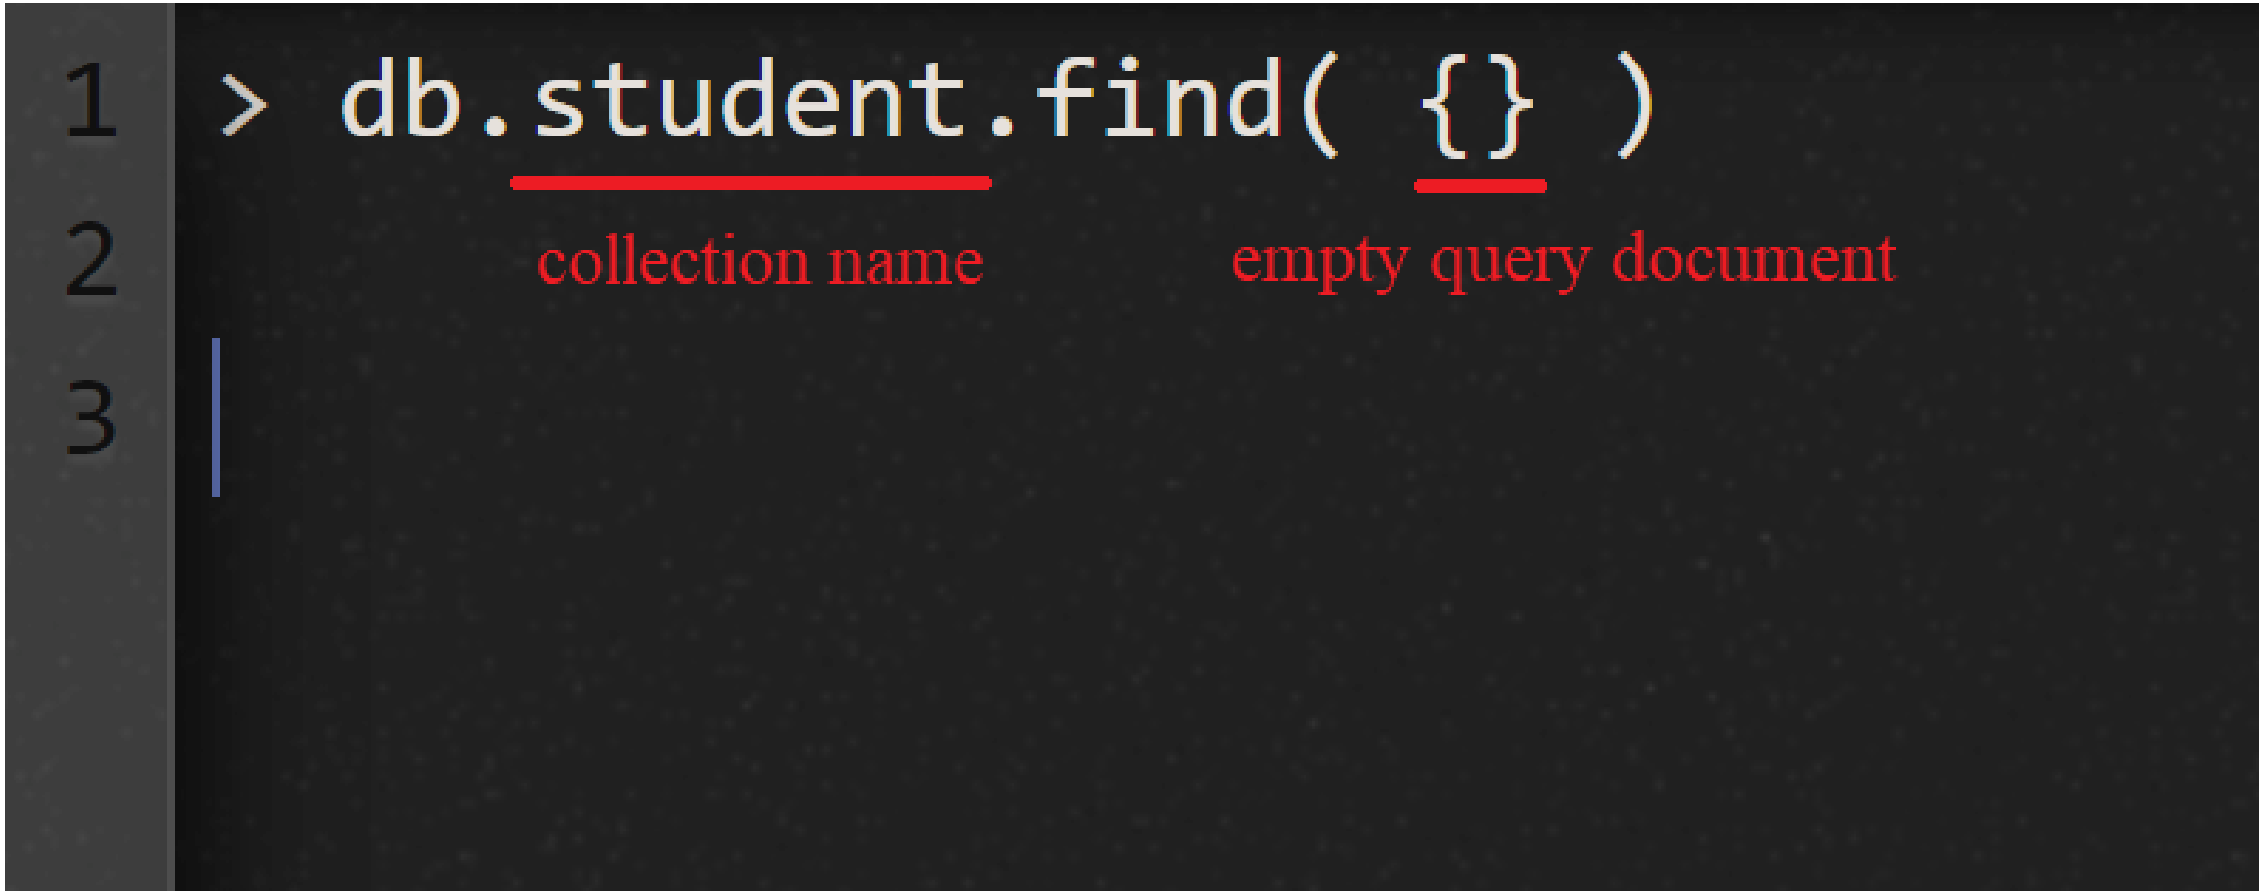
INSERTAR DOCUMENTOS

Para inserta un documento o un conjunto de documentos disponemos de los métodos:

- insertOne: Inserta un documento en una colección.
- insertMany: Inserta múltiples documentos en una colección.

CAMPO OBLIGATORIO _ID

- En MongoDB, cada documento almacenado en una colección requiere un único _id que actúa como clave principal . Si se inserta documento omite el _id, el controlador MongoDB automáticamente genera un ObjectId para el _id.



RECUPERAR DOCUMENTOS

OPERADORES COMPARACIÓN

- $eq - equal - igual
- $lt - low than - menor que
- $lte - low than equal - menor o igual que
- $gt - greater than - mayor que
- $gte - greater than equal - mayor o igual que
- $ne - not equal - distinto
- $in - in - dentro de
- $nin - not in - no dentro de

db.collection.deleteOne()

db.collection.deleteMany()

db.collection.remove()

ELIMINAR DOCUMENTOS Y BBDD

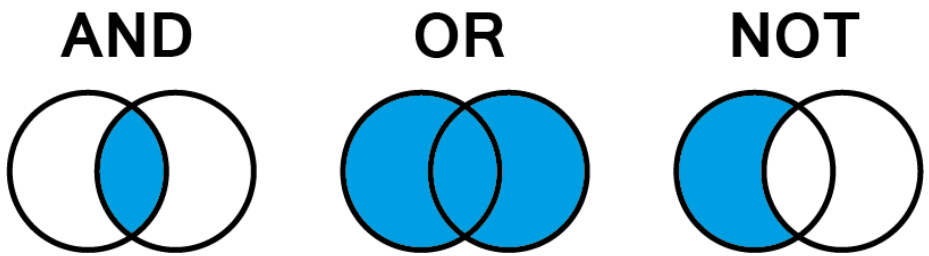
MODIFICAR UN ELEMENTO

```
> db.job.updateOne({salary:5000}, { $set: {firstName:'Morgan'}})
{ "acknowledged" : true, "matchedCount" : 1, "modifiedCount" : 1 }
> db.job.find().pretty()
{
        "_id" : ObjectId("6286f50681063f5a55d4775b"),
        "firstName" : "Morgan",
        "lastName" : "Dew",
        "email" : "john.dew@abc.com",
        "salary" : 5000
}
```

MODIFICAR MÚLTIPLES ELEMENTOS

```
db.users.updateMany(
   { age: { $lt: 18 } },
   { $set: { status: "reject" } }
)
```

OPERADORES LÓGICOS



CURSORES Y MÉTODOS

RECUPERAR SOLO ALGUNOS CAMPOS

- Hemos visto que el método 'find’:
  - Si no le pasamos parámetros nos retorna todos los documentos de la colección que hace referencia: db.libros.find({precio: 50},{titulo:1,cantidad:1,_id:0})
  - El primer parámetro en el caso que lo indiquemos filtra la colección y recupera los documentos que cumplen la condición
  - En el segundo parámetro del método 'find' debemos especificar cada campo y un valor 1 indicando que se lo quiere recuperar.

DOCUMENTOS EMBEBIDOS

```
{
  _id: <ObjectId1>,
  username: "123xyz",
  contact: {
             phone: "123-456-7890",
             email: "xyz@example.com"
           },
  access: {
             level: 5,
             group: "dev"
           }
}
```

RDBMS Vs Graph Database

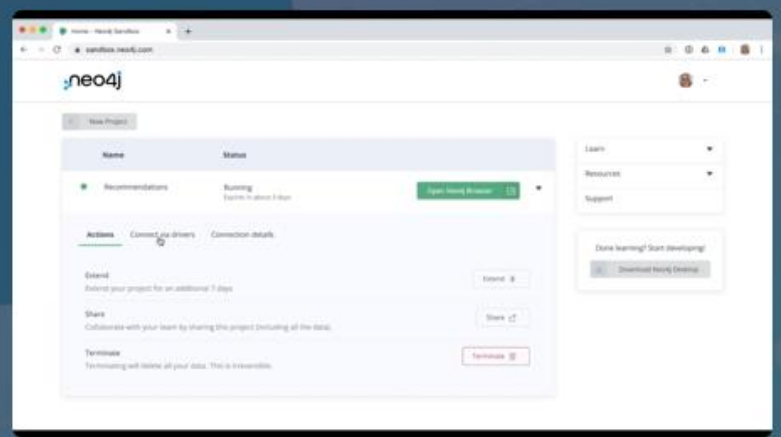
Following is the table which compares Relational databases and Graph databases.

Sr.No	RDBMS	Graph Database
1	Tables	Graphs
2	Rows	Nodes
3	Columns and Data	Properties and its values
4	Constraints	Relationships
5	Joins	Traversal

Comience a utilizar Neo4j Sandbox mientras su café aún se está preparando

Neo4j es una base de datos gráfica nativa, diseñada específicamente para aprovechar las relaciones de datos y permitir aplicaciones más ricas e inteligentes.

Lanzamiento de la zona de pruebas gratuita



Comience con los fundamentos

¿Eres principiante o estás empezando? Crea tus bases de Neo4j con estos cursos seleccionados.

Fundamentos de Neo4j

Aprenda los conceptos básicos de Neo4j y el modelo de gráfico de propiedades

1 hora →

Fundamentos de Cypher

Aprenda Cypher en 1 hora

1 hora →

Fundamentos del modelado de datos gráficos

Aprenda a diseñar un gráfico Neo4j utilizando las mejores prácticas

2 horas →

Fundamentos de la importación de datos

Aprenda a importar datos a Neo4j

2 horas →

Sr.No	Write Clause	Usage
1	CREATE	This clause is used to create nodes, relationships, and properties.
2	MERGE	This clause verifies whether the specified pattern exists in the graph. If not, it creates the pattern.
3	SET	This clause is used to update labels on nodes, properties on nodes and relationships.
4	DELETE	This clause is used to delete nodes and relationships or paths etc. from the graph.
5	REMOVE	This clause is used to remove properties and elements from nodes and relationships.
6	FOREACH	This class is used to update the data within a list.
7	CREATE UNIQUE	Using the clauses CREATE and MATCH, you can get a unique pattern by matching the existing pattern and creating the missing one.
8	Importing CSV files with Cypher	Using Load CSV you can import data from .csv files.

REDIS

- Redis es una estructura de datos en memoria que se utiliza para acceder a los datos con mayor rapidez. Se utiliza para almacenar datos a los que se debe acceder con frecuencia y rapidez. No se utiliza para almacenar grandes cantidades de datos. Si desea almacenar y recuperar grandes cantidades de datos, debe utilizar una base de datos tradicional como MongoDB o MYSQL. Redis ofrece una variedad de estructuras de datos, como conjuntos, cadenas, hashes y listas.
- El servidor Redis es un programa que se ejecuta y almacena datos en la memoria.
- Puede simplemente conectarse a ese servidor y usarlo para almacenar y recuperar datos más rápido.
- Por ese motivo, Redis no se utiliza para el almacenamiento persistente de datos, ya que se perderán todos los datos si el sistema falla.
- Redis es escalable ya que puedes ejecutar múltiples instancias del servidor.
- A menudo se utiliza como caché que almacena datos temporalmente y proporciona un acceso más rápido a los datos utilizados con frecuencia.
